#### EXTENSIVE SUMMARY

In this study it was aimed to investigate vocational high school senior year the levels of participation to recreational activities and relationship between academic achievement like multidirectional. The research sample consists of 363 senior year students determined randomly from different types of vocational high schools in Tokat province and its districts. The data collection technique of the research is questionnaire. The questionnaire consists of 4 sections; the first section is demographic variables, the second section contains academic achievement evaluation scale, the third part contains school opportunities of recreational activities likert scale and the fourth part includes frequency scale of participation to recreational activities. The data acquired in the research are subjected to statistical analyses. In the first part of the study the vocational high school students who have been studying at different school types have been learned socio-demographic characteristics. Secondly students average score notes which were asked taken in 9 10 11 grade 12th identified in 4 subjects Mathematics, Literature, English, History and academic achievement gaps are identified. In the third part it was measured students who have been continuing to learn about views on the adequacy of school facilities with a Likert-type scale method which was obtained the 4 question scale.

The qualification points are used to describe the views of the students thoughts of their answers to the questions in the scale for each student by obtaining a minimum 4 maximum 20. If the related point approaches to 4, the students school is said that he saw the possibility of inadequate schools. If the related point approaches to 20, the

students school is said that he saw the possibility of adequate schools. In the part of survey the determination of the students was to investigate the frequency of participation in recreational activities 43.
